P5

Archiware P5 Archive DLM

## P5 Archive add-on for future-proof archive and automatic data lifecycle management.

P5 Archive DLM is an extension of the P5 Archive module. It offers policy-based moving and copying of archived data between tape, cloud and disk storage. This HSM-like extension offers flexibility for any storage strategy.

Data can easily be migrated or copied between storage tiers:

Moving: Data is moved from existing to new archive storage. After completion, all data is deleted on the original archive storage.

Copying: Data is copied to create redundancy on a new archive storage. The previous archive storage remains unchanged.

This tiered storage concept allows data to be placed on different storage media according to its value, reuse and costs incurred. A migration plan runs periodically and selects data according to a predefined age.

Migrate/Replicate

Verify Media

Features of P5 Archive DLM

- Migrate and/or copy data between archive storage tiers
- Project-based storage monitoring
- Automatic archive verify
- Disk, LTO and Cloud
- Migrate from/to any LTO generation
- Policy-based
- Filter-based query
- Job history
- Optimized storage
- Optimized cost
- Optimized security
